

Here in the Netherlands at Waternet all is going fine, and my PhD research about the use of brackish groundwater for drinking water gives interesting work.

Recently one of my colleagues at Waternet, his name is Jan Peter van der Hoek, started as a professor in drinking water quality at the Technical University in Delft.

He has an idea for new PhD research and we are looking for a bright candidate to carry out the task of writing the proposal.

This will be done in half a year, which is paid for by the TU Delft.

If the proposal is rewarded, the PhD research will be carried out, preferably by the same candidate.

If you know a suitable candidate, we would appreciate it if you send this description to him or her.

I realize that the subject is drinking water treatment and not hydrology, so we would appreciate it if you forward this email to other colleagues inside or even outside your university.

Jan Peter and I are allways willing to respond on remarks or questions.

We are looking forward the reaction from suitable candidates.

Kind regards,

Frank Smits
